

Corn Farming Instructions

1. Find a spot where the crop will get at least 6 hours of full sun per day and is not prone to water logging.
2. For best results, corn should be planted in mid-March.
3. Dig up the soil to loosen it and add compost or animal manure.
4. Bury corn seeds about 2-3cm deep and about 20-30cm apart, with rows 50-90cm apart.

5. Make sure that the crops get water once per week. If there is no rain, water them manually.
6. Keep the field weed-free. Remove weeds by hand.
7. Once the silk on the ears of corn starts to turn brown, the corn is ready for harvest. This will typically take about 3-4 months.
8. To harvest the corn just grab the ear of corn and twist and pull.
